
Unit Pricing - Grocery Calculator

Posted by Registered01 - 2009/03/25 14:04

Supermarkets in Australia should now be showing unit pricing on all items that they have on their shelves. It displays the price of goods per unit measure eg 100g, 100ml, 1kg, 1l or each. It's to help you make a better choice when buying the different sizes within a brand. Here's an example of how unit pricing works...

Lets take Milo...

It's \$3.10 for a 200g tin, therefore Unit Pricing is \$1.55 per 100g, and Nestle Milo is \$9.95 for a 1kg tin, therefore Unit pricing is \$1.00 per 100g - you can decide which one is the better choice.

If you need help with the actual calculation it is the price divided by the weight/measure and then multiply x 100...

3.10 divide by 200 and then multiply x 100 = 1.55

9.95 divide by 1000 (1kg in grams) and then multiply x 100 = 1.00

Now you have your own grocery calculator!
